# Public display labels

# WAITWISE

## Bus 412

To Central Station

## University Stop

Demo location - not a real stop

**Tap to explore your journey options**

Print at actual size, cut out the labels and attach them to your cardboard backboard. Adjust the model to your tablet. The tablet stays on its own stable stand.

# Bus-stop and waiting-area signs

## BUS STOP

# 412

To Central Station

CLASSROOM DEMO

## WAITING AREA

Please leave room for other passengers
to use the shared display.

Mount the bus-stop label on a small cardboard stem and base. Use removable tape to mark a waiting area only where permitted.

# Testing plan and five tasks

**Prototype:** shared bus-stop display; cardboard setting with tablet. **Method:** English moderated think-aloud. **Participants:** students unfamiliar with the concept. **Goals:** discoverability, ETA/confidence comprehension, support-feedback understanding and journey choice.

**Logistics:** confirm Week 10 tutorial time and venue. Plan around 12-15 minutes per session. Each of five members must facilitate and record a complete session. Obtain consent first; observe tasks and collect neutral post-test feedback. Use SUS only if in the plan.

Tutorial / venue: _____ Date / time: _____

## 1. Find the arrival window

You are waiting for Bus 412 to Central Station. Use this display to find when the bus could arrive. Tell me what you think the time means.

Stable, 3-5 min. Observe range versus guaranteed countdown.

## 2. Assess reliability

You have an appointment soon. Find out how reliable the arrival estimate is and tell me how that would affect your plans.

Uncertain, 6-12 min. Observe confidence understanding.

## 3. Respond to a delay

The arrival information has now changed. Find out what changed and tell me what you would do next.

Switch to Delayed, 15-25 min. Observe recognition and interpretation.

## 4. Ask for passenger support

You are travelling with someone who uses a wheelchair. Use the display to ask about space or boarding support. Tell me what the response does and does not confirm.

Any scene. Observe selection, confirmation and limits of feedback.

## 5. Choose a journey option

You need to reach Central Station within 30 minutes. Compare the available options and choose how you would travel. Explain your choice.

Delayed. Observe total-time comparison, choice and uncertainty.

# English facilitator script

## Before recording

Use the official course consent form. Explain purpose, voluntary participation, recording access, storage, retention and withdrawal arrangements. Obtain consent before recording.

## Introduction

“Thank you for joining. We are testing a prototype, not your ability. Taking part is voluntary. You may skip a question or stop at any time. With your permission, we will record this session for our course assessment.”

## Scenario and think-aloud

“Imagine you are at a bus stop, waiting for Bus 412 to Central Station. This is a shared display at the stop. The transport information is simulated. Please use it as you normally would and say aloud what you notice, expect and think.”

## During tasks

Read one task at a time. Do not demonstrate the correct steps first. Neutral prompts: “What are you thinking?” “What would you do next?” “What did you expect to happen?” Allow exploration; record any help provided.

## Post-test questions

“Which information was most useful? What was unclear? What did you think the request response guaranteed? Would you use a display like this while waiting for a bus? Why or why not?”

## Optional format comparison

“Here are three ways to show the same arrival information. Before I explain them, which do you prefer at first glance? What makes you choose it?” Record first preference before explaining. Use identical numbers for format comparison.

## Finish

“Is there anything else you would change? Thank you for your feedback.” Collect SUS if used. Stop recording after the agreed session and reset the prototype.

# Session observation sheet

Participant code: _____ Facilitator / ID: _____

Date: _____ Scene / variants: _____

Outcomes: completed / completed with help / not completed / skipped. Record actual behaviour, hesitation, assistance and participant quotes.

| Task | Outcome / assistance | Behaviour / quote |
|---|---|---|
| 1. Find the arrival window | | |
| 2. Assess reliability | | |
| 3. Respond to a delay | | |
| 4. Ask for passenger support | | |
| 5. Choose a journey option | | |

**Post-test feedback:** _____

**Possible changes:** _____

**Other-group tutorial / group / prototype:** _____

# Build, operate and submit

## Build the physical setting

Suggested cardboard backboard: about 45 cm wide and 60 cm high, adjusted to the tablet. Add a base and two triangular braces. Attach the printed labels. Put the tablet on its own stable stand in front of the panel. Do not rely on cardboard or tape to support the device. Add a small bus-stop sign and a permitted taped waiting area.

## Open and control

Open the delivered Site on the tablet. Add ?mode=facilitator to the address for the test workspace, or use facilitator.html. Choose a scenario and A/B/C format, then open passenger view. Controls affect this browser only; they do not remotely control a different device. End session clears passenger selections and preserves the test configuration.

## Offline files

On a desktop computer, unzip the toolkit and open WaitWise_Offline.html in a browser; open WaitWise_Facilitator.html for controls. No external scripts, APIs, fonts or images are required. Mobile file-preview apps may not execute HTML scripts; use the online version on the tablet.

## Evidence and submission

Each member provides one full facilitation video, signed course consent, actual collected data and details of their participation in another group. Compile a group title page, group testing plan, five named individual sections and an AI appendix. Templates are not test results. The observation export supplements, and does not replace, the required video.

## Concept and verification limits

This is a simulated, low-fidelity public-display concept. The physical prototype form must be discussed with the tutor in advance. Functional combinations and flows were checked using a simulated DOM. Real-browser visual QA was unavailable; rehearse the five tasks on your actual tablet before the session.
